Male Reproductive System: Anatomy and Function

Primary Structures

The male reproductive system includes several key organs:

- **Testes:** Located within the scrotum, the testes are responsible for producing sperm and secreting testosterone, the primary male sex hormone. They are divided into seminiferous tubules where spermatogenesis occurs, and interstitial cells that produce testosterone.
- **Epididymis:** A coiled tube attached to each testis where sperm mature and are stored until ejaculation. It provides an environment for sperm to gain motility and fertilization capacity.
- **Vas Deferens:** A muscular tube that transports mature sperm from the epididymis to the

ejaculatory ducts during ejaculation.

- Seminal Vesicles: Glands that produce seminal fluid rich in fructose, which provides energy for sperm and enhances motility.
- Prostate Gland: Contributes additional fluid to semen, containing enzymes that help sperm survive and function within the female reproductive tract.
- Bulbourethral Glands (Cowper's Glands): Secrete a lubricating mucus that neutralizes traces of acidic urine in the urethra, facilitating ejaculation.
- Urethra: The conduit for semen during ejaculation and urine during urination, running through the penis.
- Penis: The external organ used to deliver semen into the female reproductive tract, composed of erectile tissue that facilitates penetration.

Physiological Functions

The male reproductive system's primary roles include:

- Producing viable sperm capable of fertilization.
- Secreting hormones, primarily testosterone, which governs male secondary sexual characteristics.
