algebraic topology 636 homework 7 solutions is a topic that resonates deeply with students and researchers dedicated to understanding the profound connections between algebra and topology. This particular homework set often challenges students to apply core concepts such as homotopy, homology, and fundamental groups to complex topological spaces. In this article, we will explore comprehensive solutions to Homework 7 from the Algebraic Topology 636 course, providing detailed explanations and insights to aid your understanding and mastery of the subject.

Overview of Algebraic Topology 636 Homework 7

Before delving into the solutions, it is essential to understand the context and the types of problems presented in Homework 7. Typically, this homework set emphasizes advanced applications of homology and homotopy theories, including computations of homology groups, analysis of covering spaces, and applications of the Seifert-van Kampen theorem.

Homework 7 often comprises problems such as:

- Computing homology groups of specific spaces.
- Determining fundamental groups of topological spaces.
- Analyzing the properties of covering spaces.
- Applying Mayer-Vietoris sequences to compute homology.

Understanding these core themes is crucial, as they form the backbone of the solutions discussed below.

Problem 1: Computing Homology Groups of a Wedge of Spheres

Problem Statement

Compute the singular homology groups $H_n(X)$ where $X = S^k \vee S^l$, the wedge sum of two spheres with dimensions k and l .

Solution Approach

The computation hinges on understanding how homology behaves with respect to wedge sums. The

key tool here is the wedge sum's effect on homology, which is well-understood in algebraic topology.

Step 1: Recall the Reduced Homology of Spheres

- For a sphere (S^n) :

[

$\widetilde{H}_m(S^n) =$

$\begin{cases}$

$\mathbb{Z}, \text{ \& } m = n \text{ \& } \\$

$0, \text{ \& } m \neq n$

$\end{cases}$

]

Step 2: Use the Wedge Sum Property

- The reduced homology of a wedge sum $(X \vee Y)$ satisfies:

[

$\widetilde{H}_n(X \vee Y) \cong \widetilde{H}_n(X) \oplus \widetilde{H}_n(Y)$

]

for all (n) .

Step 3: Compute $(H_n(X))$

- Since the homology groups of spheres are known, the wedge sum's homology groups are:

[

$$H_n(S^k \vee S^l) \cong$$

$$\begin{cases}$$

$$\mathbb{Z}, \text{ \& } n = k \text{ \textit{ or } } n = l \text{ \& }$$

$$0, \text{ \& } \textit{otherwise}$$

$$\end{cases}$$

$$\]$$

- For the full (non-reduced) homology, note that:

$$\[$$

$$H_0(X) \cong \mathbb{Z}$$

$$\]$$

since (X) is path-connected.

- For $(n \geq 1)$:

$$\[$$

$$H_n(X) \cong \widetilde{H}_n(X) \cong$$

$$\begin{cases}$$

$$\mathbb{Z} \oplus \mathbb{Z}, \text{ \& } n = k = l \text{ \& }$$

$$\mathbb{Z}, \text{ \& } n = k \neq l \text{ \textit{ or } } n = l \neq k \text{ \& }$$

$$0, \text{ \& } \textit{otherwise}$$

$$\end{cases}$$

$$\]$$

Final Result:

$\backslash$

$H_n(S^k \vee S^l) \cong$

$\begin{cases}$

$\mathbb{Z}, \text{ \& } n=0 \backslash \backslash$

$\mathbb{Z} \oplus \mathbb{Z}, \text{ \& } n = k = l \backslash \backslash$

$\mathbb{Z}, \text{ \& } n = k \neq l \text{ \textit{ or } } n = l \neq k \backslash \backslash$

$0, \text{ \& } \textit{otherwise}$

$\end{cases}$

$\backslash$

This solution showcases how wedge sums of spheres influence the homology groups, illustrating the additive nature of reduced homology.

Problem 2: Fundamental Group of a Wedge of Circles

Problem Statement

Determine the fundamental group $\pi_1 \left(\bigvee_{i=1}^n S^1 \right)$.

Solution Approach

The wedge sum of (n) circles, often called a bouquet of (n) circles, is a classic example in algebraic topology. Its fundamental group is known to be a free group on (n) generators.

Step 1: Recognize the Space

- The space $X = \bigvee_{i=1}^n S^1$ can be visualized as (n) circles joined at a single point.

Step 2: Use the Seifert-van Kampen Theorem

- The theorem allows the calculation of the fundamental group for spaces constructed as unions with intersection.

- Since the wedge of circles can be constructed by taking (n) copies of (S^1) and identifying a point, the fundamental group is the free product of the individual groups, which for circles is $(\mathbb{Z})$.

Step 3: Fundamental Group Calculation

- The fundamental group of a circle:

$$\pi_1(S^1) \cong \mathbb{Z}$$

- The wedge sum of (n) circles has a fundamental group:

$$\pi_1\left(\bigvee_{i=1}^n S^1\right) \cong \ast_{i=1}^n \pi_1(S^1) \cong F_n$$

where (F_n) is the free group on (n) generators.

Final Result:

$$\pi_1\left(\bigvee_{i=1}^n S^1\right) \cong F_n$$

This aligns with the intuition that loops around each circle generate independent elements, and no relations exist other than those dictated by the free group structure.

Problem 3: Covering Space of a Torus

Problem Statement

Describe all connected covering spaces of the torus $(T^2 = S^1 \times S^1)$.

Solution Approach

The classification of covering spaces relies on the fundamental group of the base space. Since the torus (T^2) has a well-understood fundamental group, this problem becomes manageable.

Step 1: Fundamental Group of the Torus

- The fundamental group:

$$\pi_1(T^2) \cong \mathbb{Z} \times \mathbb{Z}$$

Step 2: Covering Spaces Correspond to Subgroups

- Covering spaces correspond to conjugacy classes of subgroups of $(\pi_1(T^2))$.
- Since $(\pi_1(T^2))$ is abelian, conjugacy classes are just subgroups.

Step 3: Classify Subgroups

- All subgroups of $(\mathbb{Z} \times \mathbb{Z})$ are of the form:

$$H_{\{m,n\}} = m\mathbb{Z} \times n\mathbb{Z}$$

for $(m, n \in \mathbb{N})$, possibly infinite.

- The index of $(H_{m,n})$ in $(\mathbb{Z} \times \mathbb{Z})$ is (mn) .

Step 4: Corresponding Covering Spaces

- Each subgroup $(H_{m,n})$ corresponds to a covering space $(\tilde{T}^2)$ with:

π_1

$$\pi_1(\tilde{T}^2) \cong H_{m,n}$$

π_1

- The covering space is topologically a torus (T^2) "wrapped" (m) and (n) times around the base torus in each direction.

Final Result:

- All connected covering spaces of (T^2) are tori (T^2) with fundamental groups $(H_{m,n})$, i.e., the degree (mn) covers.

- The universal cover corresponds to $(H_{1,1} = \mathbb{Z} \times \mathbb{Z})$, which is simply (T^2) itself, indicating the universal cover is $(\mathbb{R}^2)$.

Problem 4: Mayer-Vietoris Sequence for a Decomposition

Problem Statement

Use the Mayer-Vietoris sequence to compute the homology groups of the wedge of two spaces $(X = A \cup B)$, where (A) and (B) are subspaces with known homology.

Solution Approach

The Mayer-Vietoris sequence is a powerful tool for computing the homology of complicated spaces via simpler subspaces.

Step 1: Recall the Mayer-Vietoris Sequence

- For spaces $(A, B \subseteq X)$ with $X = A \cup B$

Among the many courses dedicated to this subject, Algebraic Topology 636 stands out for its rigorous approach and comprehensive curriculum. A pivotal component of this course involves homework assignments designed to deepen understanding and test mastery of complex concepts. In particular, Homework 7 of Algebraic Topology 636 has garnered significant attention, not only for its challenging problems but also for the detailed solutions that elucidate core principles. This article aims to critically analyze the solutions to Algebraic Topology 636 Homework 7, exploring their mathematical foundations, correctness, and pedagogical value.

Overview of Algebraic Topology 636 and Homework 7

Algebraic Topology 636 is a graduate-level course that typically covers advanced topics such as homotopy theory, homology and cohomology theories, fiber bundles, and spectral sequences. Homework assignments serve as essential tools for reinforcing these concepts and developing problem-solving skills. Homework 7, in particular, focuses on a combination of the following themes:

- Computation of homology groups for complex spaces
- Application of the Mayer-Vietoris sequence
- Fundamental group calculations
- Examination of covering spaces and their properties
- Use of algebraic invariants to distinguish topological spaces

The solutions provided for Homework 7 are often detailed, with step-by-step explanations that aim to clarify intricate arguments. They serve as a valuable resource for students seeking to understand not just the "what" but the "why" behind each answer.

Key Problems and Their Significance

While the specific problems vary depending on the instructor's focus, typical Homework 7 problems include:

- Computing Homology of Complex Spaces

For example, calculating (H_n) for spaces formed by attaching cells or taking wedges of spheres.

- Applying Mayer-Vietoris

Using the Mayer-Vietoris sequence to compute homology groups of spaces decomposed into simpler subspaces.

- Fundamental Group Calculations

Determining (π_1) for spaces obtained via quotient or identification maps.

These problems are significant because they synthesize multiple algebraic topology techniques, requiring students to integrate knowledge and develop problem-solving strategies.

Sample Problem Analysis: Computing Homology via Mayer-Vietoris

One typical problem involves computing the homology groups of a space constructed by gluing simpler spaces, such as a wedge of spheres or a torus with a sphere attached along a subspace. The solutions generally involve:

- Choosing an appropriate open cover
- Applying the Mayer-Vietoris sequence
- Computing the intersection homology
- Carefully tracking the connecting homomorphisms

The solutions often include diagrams illustrating the decomposition, explicit calculations of chain complexes, and justification for the exactness of sequences used.

Methodology of the Provided Solutions

The solutions to Homework 7 exemplify best practices in mathematical exposition, emphasizing transparency, logical progression, and contextual understanding. For students, engaging with these solutions can:

- Reinforce understanding of complex algebraic techniques
- Illustrate the interconnectedness of topological invariants
- Improve problem-solving skills through example-driven learning
- Prepare for research-level applications where similar methods are employed

For instructors, these solutions serve as models for designing effective feedback and guiding students through intricate arguments.

Challenges and Limitations

Despite their strengths, the solutions are not without limitations:

- Assumed Background Knowledge: They often presuppose familiarity with advanced concepts, potentially alienating less experienced students.
- Potential for Oversimplification: Some steps may omit subtle details necessary for complete understanding.
- Variability in Detail: Not all solutions exhibit uniform depth, which can lead to confusion or gaps in comprehension.

Addressing these challenges involves supplementing the solutions with additional explanations, background material, and contextual examples.
