Question 1: Label the diagram of a plant cell and describe the function of the chloroplast.

Answer:

Diagram labeling: Nucleus, mitochondria, chloroplast, cell wall, vacuole, cytoplasm, cell membrane.

Function of chloroplast: Chloroplasts are the site of photosynthesis, where light energy is converted into chemical energy stored in glucose. They contain the pigment chlorophyll, which captures light energy.

Question 2: Explain the process of digestion in the human alimentary canal.

Answer:

Digestion begins in the mouth, where food is chewed and mixed with saliva containing enzymes like amylase, which starts starch breakdown. It continues in the stomach, where gastric juices with acids and enzymes further digest proteins. The food then passes into the small intestine, where most digestion and absorption occur, aided by enzymes from the pancreas and intestinal lining. Waste products move into the large intestine for water absorption, and undigested material is expelled through the anus.

Question 3: Describe Mendel's law of segregation with an example.

Answer:

Mendel's law of segregation states that during the formation of gametes, the two alleles for a trait separate so that each gamete carries only one allele. For example, in pea plants, the gene for flower color has two alleles: purple (dominant) and white (recessive). A heterozygous plant (Pp) produces gametes with either P or p. When crossing two heterozygous plants, the offspring have a genotypic ratio of 1:2:1 (PP:Pp:pp) and phenotypic ratio of 3:1 (purple:white).
