Question What are the main functions of the cardiovascular system in veterinary physiology? The cardiovascular system in veterinary physiology is responsible for transporting nutrients, oxygen, hormones, and waste products throughout the body, maintaining blood pressure, and regulating temperature. It includes the heart, blood vessels, and blood components essential for efficient circulation. How does the respiratory system adapt to different animal species in veterinary physiology? Different species have specialized respiratory adaptations; for example, birds have air

sacs for continuous airflow, while aquatic mammals have increased lung capacity for diving. Veterinary physiology notes highlight these variations to understand species-specific respiratory functions. What is the significance of the renal system in maintaining fluid and electrolyte balance in animals? The renal system regulates fluid volume, electrolyte concentrations, and pH levels, which are vital for normal cellular function. Veterinary physiology emphasizes how kidneys filter blood, reabsorb essential substances, and excrete waste to maintain homeostasis. How do endocrine glands influence physiological processes in animals? Endocrine glands secrete hormones that regulate growth, metabolism, reproduction, and stress responses. Veterinary physiology notes detail how hormonal balance affects overall health and how disruptions can lead to disease. What role does the nervous system play in coordinating physiological responses in veterinary medicine? The nervous system coordinates rapid responses to stimuli, controls muscle movements, and regulates organ functions through neural pathways. Veterinary physiology highlights the importance of neural control in maintaining homeostasis. How is muscle physiology explained in veterinary lecture notes? Muscle physiology covers the structure and function of skeletal, cardiac, and smooth muscles, including mechanisms of contraction, energy utilization, and fatigue. These notes help understand movement, cardiac function, and involuntary processes. What are the key physiological differences between domestic animals and wild species?
